INTERNSHIP REPORT ON BACKEND DEVELOPMENT (LARAVEL) AT MIDAS HEALTH SERVICES

-

SUBMITTED BY:

NAME: BARSHA DANGI

LC NO: LC00022001632

INTERNSHIP REPORT SUBMITTED IN PARTIAL FULFILMENT FOR THE DEGREE OF BACHELOR OF INFORMATION TECHNOLOGY (HONS)

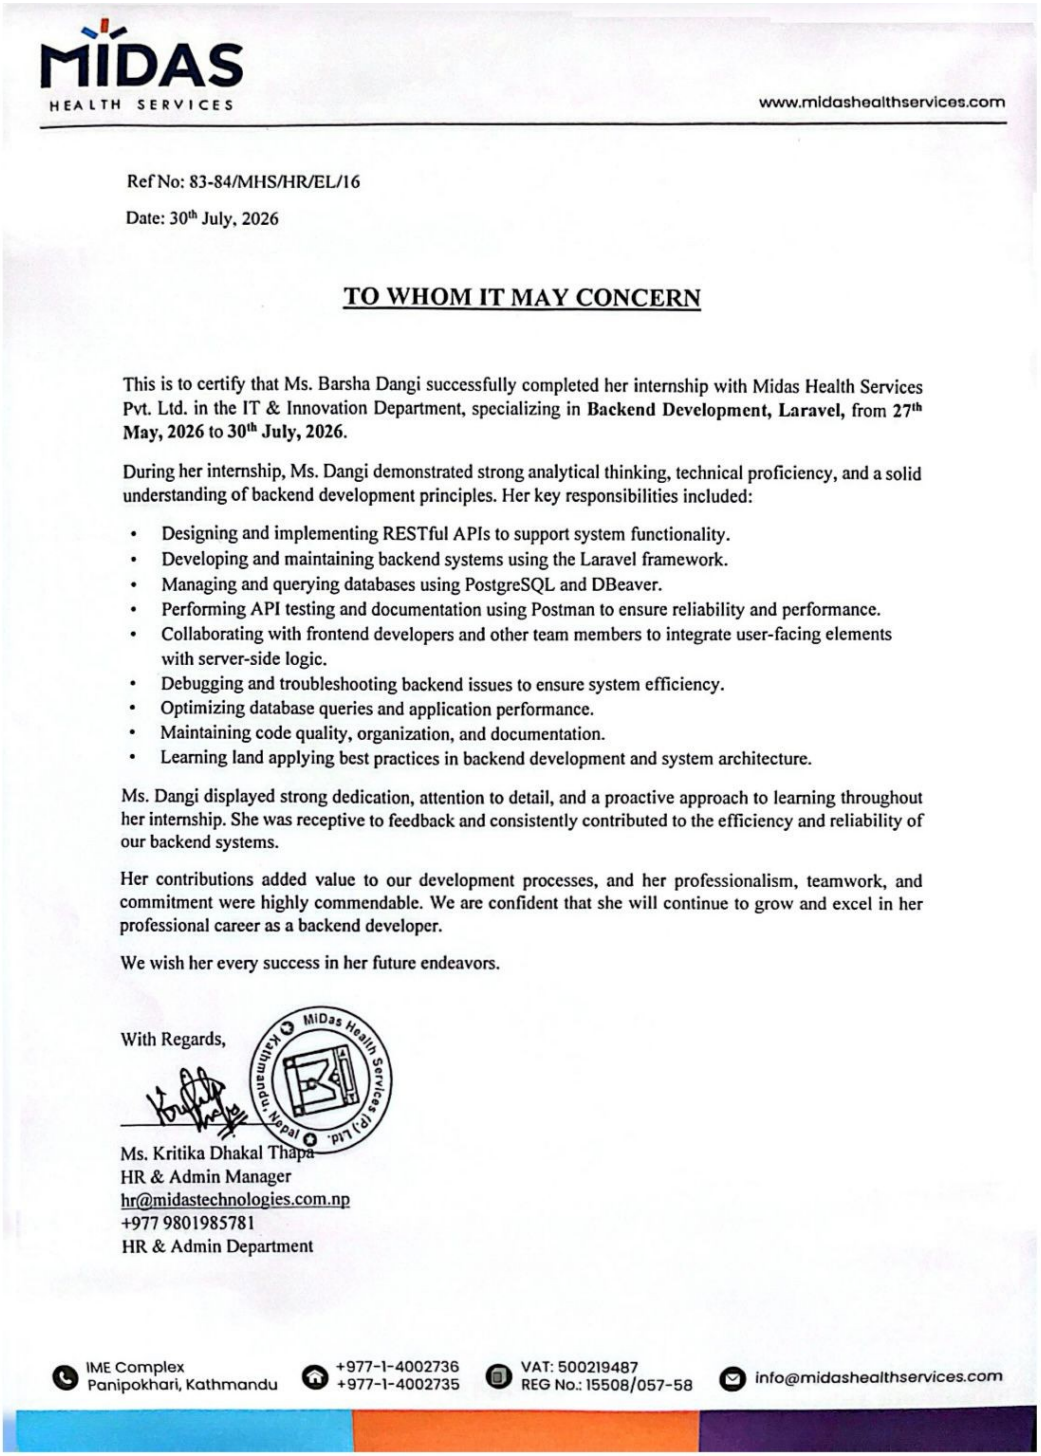

FACULTY OF COMPUTER SCIENCE AND MULTIMEDIA

LINCOLN UNIVERSITY COLLEGE

MALAYSIA

SEPTEMBER 2026

INTERNSHIP EXPERIENCE LETTER

MIDAS
HEALTH SERVICES

www.midashealthservices.com

Ref No: 83-84/MHS/HR/EL/16

Date: 30th July, 2026

TO WHOM IT MAY CONCERN

This is to certify that Ms. Barsha Dangi successfully completed her internship with Midas Health Services Pvt. Ltd. in the IT & Innovation Department, specializing in **Backend Development, Laravel,** from **27th May, 2026** to **30th July, 2026**.

During her internship, Ms. Dangi demonstrated strong analytical thinking, technical proficiency, and a solid understanding of backend development principles. Her key responsibilities included:

- Designing and implementing RESTful APIs to support system functionality.
- Developing and maintaining backend systems using the Laravel framework.
- Managing and querying databases using PostgreSQL and DBeaver.
- Performing API testing and documentation using Postman to ensure reliability and performance.
- Collaborating with frontend developers and other team members to integrate user-facing elements with server-side logic.
- Debugging and troubleshooting backend issues to ensure system efficiency.
- Optimizing database queries and application performance.
- Maintaining code quality, organization, and documentation.
- Learning land applying best practices in backend development and system architecture.

Ms. Dangi displayed strong dedication, attention to detail, and a proactive approach to learning throughout her internship. She was receptive to feedback and consistently contributed to the efficiency and reliability of our backend systems.

Her contributions added value to our development processes, and her professionalism, teamwork, and commitment were highly commendable. We are confident that she will continue to grow and excel in her professional career as a backend developer.

We wish her every success in her future endeavors.

With Regards,

MiDas Health Services (P.) Ltd. Kathmandu, Nepal

RECOMMENDATION LETTER FROM COLLEGE

STUDENT DECLARATION

I hereby declare that this internship report titled "*Internship Report on Backend Development (Laravel Internship)"* is prepared by me based on the practical experience gained during my internship at *Midas Health Services Pvt. Ltd, Kathmandu* from May 27th 2026 to July 30th 2026. I further declare that this report has not been submitted previously in part or full for the award of any degree, diploma, or other academic qualification of any university or institution. All information and data presented in this report are true to the best of my knowledge and belief.

Name: Barsha Dangi

LC no: LC00022001632

Signature:_____

Date:_____

LETTER OF APPROVAL

This internship report entitled "Internship Report on Backend Development (Laravel Internship) at Midas Health Services Pvt. Ltd, Kathmandu " submitted by Barsha Dangi in partial fulfilment of the requirements for the award of the degree of Bachelor of Information Technology (Hons) has been examined and approved by the undersigned evaluators.

This report is accepted as a well-documented record of the knowledge, skills, and practical experience gained during the internship at Midas Health Services

_____	_____
Prakash Gurung	Madhu Sudan Nepal
HOD, BIT Faculty	Project Supervisor
Balmiki Lincoln College	Balmiki Lincoln College
_____	_____
Date	Date

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to everyone who contributed to the successful completion of my internship and this report. First and foremost, I would like to thank *Midas Health Services Pvt. Ltd,* for providing me with the opportunity to undertake my internship as a Backend Developer / Laravel Intern. The internship offered me valuable practical exposure to professional backend development practices and helped me bridge the gap between academic knowledge and industry practice.

I am especially grateful to Anusha Pandey Supervisor for continuous guidance, encouragement, and support throughout the internship period. Their mentorship, constructive feedback, and willingness to share professional experience significantly contributed to my learning and professional development.

I would also like to extend my appreciation to all members of the development team at Midas Health Services Pvt. Ltd for their cooperation, guidance, and friendly working environment. Their support enabled me to gain hands-on experience in backend development, database design, and API development.

Furthermore, I would like to express my heartfelt thanks to the faculty members and administration of *Balmiki Lincoln College* for providing the academic foundation and encouragement necessary to complete this internship successfully.

ABSTRACT

This internship report presents the experiences, activities, and learning outcomes gained during my internship as a Backend Developer / Laravel Intern at *Midas Health Services Pvt. Ltd* from *May 16, 2026, to July 26, 2026*. The internship was undertaken as a partial fulfilment of the requirements for [Insert Degree Program] and provided an opportunity to gain practical exposure to professional backend software development in a real working environment.

During the internship period, I was involved in the design and development of a Staff Attendance and Roster Management System, a healthcare-oriented application built using PHP and the Laravel framework, with PostgreSQL as the underlying database. My work included designing database schemas and migrations, building RESTful API endpoints, implementing authentication and authorization, applying backend validation, and testing API functionality using Postman. I also used DBeaver for database management and Visual Studio Code as my primary development environment.

The internship enabled me to develop a deeper understanding of the MVC (Model-View-Controller) architecture, Eloquent ORM, database relationships, and the overall Software Development Life Cycle (SDLC). In addition to technical skills, I enhanced my communication, teamwork, requirement analysis, and problem-solving abilities through collaboration with mentors and fellow developers.

Overall, the internship served as a valuable learning experience that strengthened both my technical and professional competencies

CHAPTER ONE

INTRODUCTION AND BACKGROUND

1.1 INTRODUCTION AND BACKGROUND

Internships serve as an essential bridge between academic learning and professional practice. They provide students with the opportunity to apply theoretical knowledge in real-world environments, develop practical skills, and gain exposure to industry standards and workflows. In the field of software engineering, internships play a crucial role in helping students understand software development processes, teamwork, and organizational culture from the perspective of a working professional rather than a classroom learner.

Backend development is a critical component of modern software systems. While users interact directly with a website or mobile application's interface, it is the backend that manages data, enforces business logic, handles authentication, and ensures that information flows correctly and securely between the client and the database. Frameworks such as Laravel, together with relational databases like PostgreSQL and well-structured REST APIs, allow developers to build applications that are reliable, maintainable, and scalable. Understanding how these components work together is essential for any aspiring software engineer.

This internship was carried out at Midas Health Services Pvt .Ltd sfrom *May 16, 2026, to July 26, 2026,* where I worked as a Backend Developer / Laravel Intern under the supervision of [Insert Supervisor Name and Title]. During the internship period, I was involved in the design and development of a healthcare-oriented backend system, gaining hands-on experience in Laravel development, database design, REST API development, and API testing. The internship provided valuable

insight into professional backend development workflows and strengthened my understanding of how real-world software systems are designed and maintained.

1.2 OBJECTIVES OF INTERNSHIP

The objectives of the internship are outlined below.

1.2.1 General Objective

- To gain practical exposure to professional backend software development.
- To apply theoretical knowledge acquired during academic studies to a real-world software project.
- To develop technical skills in Laravel-based backend development.
- To understand industry-standard software development workflows and practices.
- To enhance problem-solving, analytical thinking, and debugging skills.
- To improve communication, teamwork, and professional work ethics through collaboration with mentors and developers.
- To bridge the gap between academic learning and industry requirements for future career development.

1.2.2 Specific Objectives

To reach the main goal, I had several specific targets during my time at Midas Health Services. Pvt. Ltd These were to:

- Design and implement database schemas and Laravel migrations for a healthcare-oriented system.

- Build RESTful API endpoints for staff, department, roster, attendance and leave management modules.
- Implement authentication, authorization, and backend validation for the application.
- Test API endpoints thoroughly using Postman to verify request and response data.
- Work closely with experienced developers to understand requirements and follow established coding practices.

1.3 SCOPE OF THE INTERNSHIP

The internship primarily focused on backend development activities related to a healthcare-oriented staff attendance and roster management system. The scope included understanding functional requirements, designing database tables and relationships, developing Laravel controllers, models and routes, building and testing REST API endpoints, implementing authentication and validation, and maintaining clear, organized backend code. The internship also provided opportunities to collaborate with mentors and developers, enabling a broader understanding of professional software development practices

1.4 DURATION AND LOCATION

The internship took place at Midas Health Services Pvt.Ltd, located at Panipokhari Kathmandu The total duration of the internship was, starting May 27th 2026. and officially ending to July 30th 2026. I worked directly from the company's office every day. Being in the office was very helpful because it allowed me to sit close to the development team, use the company's testing environment.

1.5 ORGANIZATION OF THE REPORT

This report is organized into the following chapters:

- Chapter One: Introduction - presents the background, objectives, scope, and structure of the report.
- Chapter Two: Organization Overview - provides an overview of Midas Health Services, its background, services, and organizational structure.
- Chapter Three: Internship Activities - describes the tasks performed, responsibilities undertaken, tools used, and the project developed during the internship.
- Chapter Four: Learning and Achievements - discusses the technical and professional skills gained, challenges faced, and solutions implemented.
- Chapter Five: Evaluation and Reflection - reflects on my contribution, strengths and areas for improvement.
- Chapter Six: Conclusion -summarizes the overall internship experience and its contribution to my academic and professional development.

CHAPTER TWO

ORGANIZATION OVERVIEW

2.1 INTRODUCTION TO THE COMPANY

Midas Health Services is a leading healthcare Information system solution provider in Nepal. Midas Health Services is a leading healthcare Information system solution provider in Nepal. Our system solution sustains and enhances healthcare services in Nepal. It's backed by over 20 years of experienced team members, many of whom are expert domain consultants and accomplished professionals with extensive work experience in healthcare ERP system solutions. We focus on improving outcomes of our healthcare partners and redefine patient care.

With the introduction of Mero Doctor - a cloud-based healthcare service platform designed for individual doctors, healthcare institutions and patient to bridge the medical gap through online video-consultation, online appointment and EMR; we are determined to mark a significant step forward in further embracing the strength of digital and mobile technology, to make health services more inclusive and affordable, particularly for underserved and rural patient nationwide.

For more than 20 years, Midas Health Services has built a strong reputation for offering a trustworthy, secure and reliable hospital management solution for our health partners in Nepal. We are committed to providing a wide-range of healthcare solutions to ensure our health partner can provide efficient service to their patient.

Figure 2.1.1: Logo of the company

2.2 VISION AND MISSION

Every successful organization is guided by a clear vision and mission.

2.2.1 Vision

To evolve into an integrated healthcare system solution provider with an aim to create an omnipresent healthcare ecosystem that connects patients, doctors, pharmacies, diagnostics, clinics, public health centers, and hospitals with seamless technology to ultimately build a nation in which all people achieve their full potential for health and well-being across the lifespan..

2.2.2 Mission

To evolve into an integrated healthcare system solution provider with an aim to create an omnipresent healthcare ecosystem that connects patients, doctors, pharmacies, diagnostics, clinics, public health centers, and hospitals with seamless technology to ultimately build a nation in which all people achieve their full potential for health and well-being across the lifespan..

.

2.3 PRODUCT AND SERVICES

The products are designed for different types of healthcare organizations, from large hospitals to small clinics and laboratories. The Product are

1. HCMS - Health Care Management System

HCMS is a complete hospital management system designed mainly for medium and large healthcare centers.

It integrates major hospital operations into one system, including:

- Patient registration
- Electronic Medical Records (EMR)
- Patient billing
- Admission and discharge
- Laboratory management
- Radiology
- Pharmacy management
- Inventory and procurement
- Accounting
- Payroll and staff management
- Health insurance and SSF integration
- Reports and management information systems

The system has multiple integrated modules and can support web, desktop, cloud, and mobile platforms.

2. HCMS Lite -Health Care Management System Lite

HCMS Lite is a simplified version of HCMS designed for small and medium-sized hospitals.

Its main features include:

- Patient registration
- Patient billing
- Laboratory Information Management
- Pharmacy Management

- Patient admission
- Patient discharge
- Basic accounting

It is intended for healthcare organizations that need an integrated management system but may not require all the advanced modules of a large hospital system.

3. LIS -Laboratory Information System

LIS is designed specifically for managing laboratory operations.

It centralizes laboratory activities so that organizations do not need separate systems for different laboratory functions. The product includes functions such as:

- Patient registration
- Patient billing
- Laboratory Information Management

The main goal is to streamline laboratory workflows, manage information centrally, and improve operational efficiency.

4. CLINICLO -Clinic Cloud Management System

CLINICLO is a cloud-based management system designed for clinics and healthcare practices.

Its features include:

- Patient registration
- Patient billing
- Laboratory management

- Pharmacy management
- SMS integration
- Email reporting

Because it is cloud-based, the system can be accessed from different locations through an internet connection.

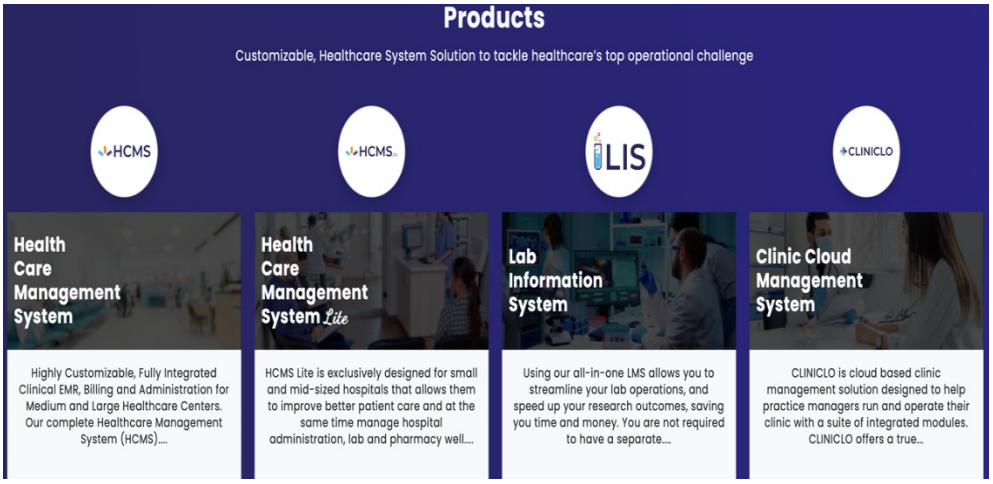

Figure 2.3.1: Product of Midas Health Services Pvt.Ltd

CHAPTER THREE

INTERNSHIP ACTIVITIES

3.1 ROLE AND RESPONSIBILITIES

As a Backend Developer / Laravel Intern at Midas Health Services, my primary role was to assist in the design and development of backend functionality for a healthcare-oriented internal application under the guidance of experienced developers. My responsibilities included:

- Designing and implementing database tables and relationships using Laravel migrations.
- Developing Eloquent models to represent staff, departments, rosters, attendance, and leave records.
- Writing controllers and routes to handle application logic and expose REST API endpoints.
- Implementing backend validation for incoming requests to ensure data integrity.
- Implementing authentication and protecting routes according to user roles.
- Testing API endpoints using Postman and verifying request/response behaviour.
- Managing and inspecting the PostgreSQL database using DBeaver.
- Debugging backend errors and collaborating with mentors to resolve issues.

3.2 DAILY ACTIVITIES

A typical working day during the internship involved reviewing assigned tasks, discussing requirements and progress with the mentor/development team, writing and testing backend code, and documenting progress. Activities generally included:

- Reviewing requirements for the module assigned for the day (e.g. staff management, roster management, attendance).
- Writing Laravel migrations, models, controllers, and routes for the assigned module.
- Testing developed API endpoints in Postman before marking the task complete.
- Debugging issues encountered during development, with guidance from senior developers where needed.
- Participating in short discussions with mentors to clarify requirements and receive feedback on code quality.
- Updating task progress and preparing for the next day's work.

3.3 PROJECT WORKED ON

The major project I worked on during my internship was the Staff Attendance and Roster Management System, developed for a healthcare/hospital-oriented use case, since Midas Health Services builds software solutions related to healthcare and hospital management.

Project Background and Problem Statement

Hospitals and healthcare facilities typically employ a large number of staff working across multiple departments and shifts. Manually tracking staff schedules, attendance, and leave requests is time-consuming and prone to error. The Staff Attendance and Roster Management System was designed to address this problem by providing a centralized backend system to manage staff information, department assignments, work rosters, attendance records, and leave requests in an organized and reliable manner.

Project Objectives

- To provide a centralized system for managing hospital staff information and department assignments.
- To allow administrators to create and manage work rosters and assign staff to shifts.
- To accurately record and track staff attendance, including check-in/check-out and late-minute calculation.
- To provide a structured leave request and approval workflow.
- To expose the above functionality through secure, well-tested REST APIs.

Target Users

- Hospital administrators -manage staff, departments, and rosters.
- Staff members -check in/check out, view schedules, and submit leave requests.
- Department heads/supervisors - review attendance and approve or reject leave requests.

Major Modules

- Staff Management-add, edit, and view staff details; manage roles and departments; activate/deactivate staff.

- Department Management -create, update, and view departments; assign staff to departments.
- Roster/Shift Management- create rosters, assign staff to morning, afternoon and night shifts, and manage roster dates.
- Attendance Management -record staff check-in/check-out, attendance status (present/absent/late/leave), late-minute calculation, and working-hour tracking.
- Leave Management -staff leave requests, leave status tracking, and an approval/rejection workflow.
- Authentication -staff login, protected routes, and role-based access where implemented.
- Dashboard and Reports -attendance summaries, roster information, and monthly/working-hour summaries.

Backend Architecture and Database Design

The system followed Laravel's MVC (Model-View-Controller) architecture. Models represented database entities such as staff, departments, rosters, attendance records and leave requests, using Eloquent ORM for database operations. Controllers contained the application logic for each module, while routes exposed this logic as REST API endpoints. Relationships between tables such as a staff member belonging to a department, or an attendance record belonging to both a staff member and a roster were implemented using foreign keys and Eloquent relationships (e.g. belongsTo, hasMany).

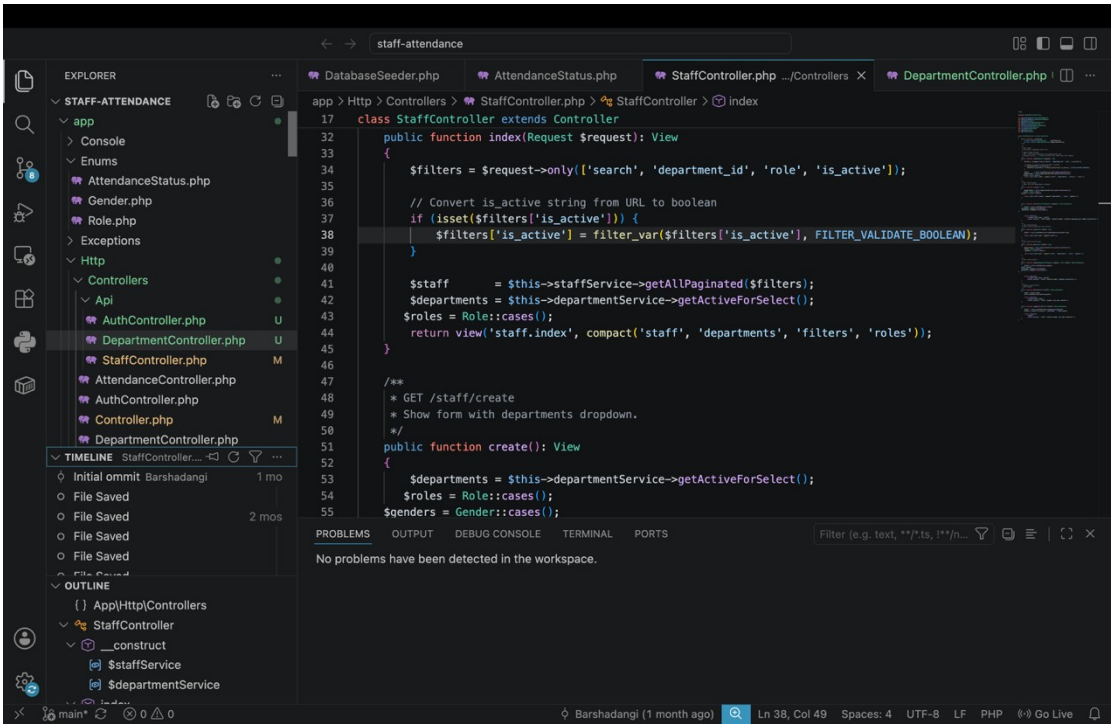

Figure 3.3.1: Laravel Project Directory Structure

API Development, Authentication and Validation

Backend API endpoints were developed to support GET, POST, PUT/PATCH and DELETE operations across the different modules, with JSON used as the standard response format. Request data was validated using Laravel's built-in validation features before being processed, to ensure data integrity and prevent invalid records from being stored. Authentication was implemented to restrict access to protected routes, ensuring that only authorized staff could perform certain actions.

API Testing and Database Management

All developed API endpoints were tested using Postman, where request parameters, headers, and response data were verified for correctness before the endpoints were considered complete. The PostgreSQL database was managed and

inspected using DBeaver, which was used to review table structures, verify data after API operations, and troubleshoot issues during development.

Challenges During Implementation and My Contribution

During the development of this project, I contributed to designing database tables and relationships, building Laravel models, controllers and routes for several modules, implementing backend validation, and testing the resulting API endpoints. I worked under the guidance of senior developers, who reviewed my code and provided feedback that helped me improve the structure and reliability of my work.

3.4 TOOLS AND TECHNOLOGIES USED

- PHP :the core programming language used for backend development.
- Laravel :the PHP framework used to structure the application following the MVC pattern.
- PostgreSQL : the relational database management system used to store application data.
- DBeaver :used for managing and inspecting the PostgreSQL database.
- Postman :used for testing and verifying REST API endpoints.
- Visual Studio Code : the primary code editor used for development.
- Eloquent ORM : used to interact with the database through Laravel models.

]

3.5 SKILLS APPLIED

- Understanding and applying Laravel's MVC architecture.
- Designing relational database schemas and relationships.
- Writing and running Laravel migrations.

- Building and consuming REST APIs.
- Implementing backend validation and authentication.
- Testing APIs systematically using Postman.
- Debugging backend errors and reading error logs.
- Communicating with mentors to clarify requirements and receive feedback.

CHAPTER FOUR

LEARNING AND ACHIEVEMENTS

4.1 TECHNICAL SKILLS GAINED

Through this internship, I gained hands-on technical knowledge in several areas of backend development, including:

- Laravel MVC architecture - understanding how routes, controllers, models and views (or, in this case, JSON responses) work together.
- Routing -defining and organizing API routes for different modules.
- Eloquent ORM -performing database operations and defining relationships between models.
- Database migrations -creating and modifying database tables in a version-controlled manner.
- Database relationships - implementing one-to-many and other relationships between staff, departments, rosters and attendance records.
- Form/request validation - validating incoming API requests before processing them.
- REST API design -structuring endpoints and using appropriate HTTP methods.
- Authentication -implementing login functionality and protecting routes.
- PostgreSQL - writing and understanding SQL concepts underlying an Eloquent-based application.
- API testing with Postman -verifying request and response data systematically.
- Database management using DBeaver -inspecting tables, running queries and verifying data.

4.2 PROFESSIONAL SKILLS GAINED

- Communication discussing requirements and progress clearly with mentors and developers.
- Requirement understanding translating module descriptions into concrete backend implementation.
- Problem solving breaking down backend issues into smaller, manageable steps.
- Code organization and maintainability structuring controllers, models, and routes in a clean and understandable way.
- Time management completing assigned modules within expected timeframes.
- Adaptability adjusting to feedback and revising implementation based on mentor guidance.

4.3 CHALLENGES FACED

Like any learning experience, the internship came with its share of challenges, particularly in the early weeks. Some of the main challenges I faced included:

- Understanding Laravel's overall architecture and how its components (routes, controllers, models, migrations) fit together.
- Designing appropriate database relationships between staff, departments, rosters, attendance and leave records.
- Working with migrations, especially when modifying existing table structures without breaking existing data.
- Configuring and connecting the application correctly to the PostgreSQL database.

- Handling API request and response formats consistently across different endpoints.
- Resolving validation errors and ensuring clear, useful error messages were returned to API consumers.
- Understanding and correctly implementing authentication and protected routes.
- Debugging backend errors, including tracing issues through Laravel's error logs.
- Handling database constraints, such as foreign key relationships, without causing data integrity issues.
- Understanding Eloquent relationships (e.g. distinguishing hasMany from belongsTo in different contexts).
- Organizing controllers and services so that code remained clean and maintainable as the project grew.
- Testing APIs systematically with Postman rather than relying on ad-hoc checks.

4.4 SOLUTIONS IMPLEMENTED

These challenges were addressed gradually through a combination of mentor guidance, official documentation, hands-on debugging, and consistent practice. Whenever I encountered an unfamiliar concept, I referred to Laravel's official documentation and discussed unclear areas with my mentor and other developers on the team. Debugging errors particularly those related to database relationships and validation — was approached systematically by reviewing error messages, checking

the relevant migration and model definitions, and testing changes incrementally using Postman.

Over time, I developed a habit of testing each API endpoint immediately after writing it, rather than waiting until a module was fully complete, which helped me catch issues earlier and understand their root causes more clearly. Regular feedback from senior developers on my code structure also helped me improve how I organized controllers and services, leading to cleaner and more maintainable code as the internship progressed.

CHAPTER FIVE

EVALUATION AND REFLECTION

5.1 CONTRIBUTION TO ORGANIZATION

During my internship at Midas Health Services, I contributed to the development of the Staff Attendance and Roster Management System by designing database tables and relationships, implementing backend logic for several modules, and testing the resulting API endpoints. While working under the supervision of experienced developers, I aimed to write clean, well-organized code and to thoroughly test my work before it was reviewed, so as to minimize the amount of rework required by the team.

5.2 INTERNSHIP EXPERIENCE

This internship gave me my first real exposure to professional backend development in a team setting. Unlike academic assignments, where requirements are often clearly defined in advance, I learned that real-world requirements sometimes need to be clarified and refined through discussion with mentors and stakeholders. Working on a healthcare-oriented system also helped me appreciate the importance of accuracy and reliability in backend systems, since incorrect attendance or roster data could have real consequences for staff scheduling.

5.3 KNOWLEDGE GAINED

Beyond the specific technologies used, I gained a broader understanding of how backend systems are designed, from identifying entities and their relationships, to implementing them as database tables, to exposing their functionality through REST APIs. I also gained practical insight into the Software Development Life Cycle

(SDLC), particularly the stages of requirement analysis, design, implementation, testing and review, as these stages were reflected in the day-to-day workflow of the internship.

5.4 STRENGTHS AND WEAKNESSES IDENTIFIED

Reflecting on the internship period helped me identify my core strengths as a backend developer, as well as specific areas where I need further improvement.

5.4.1 Personal Strengths

- Problem solving breaking down backend requirements into clear, implementable steps.
- Database understanding designing reasonable table structures and relationships for a given problem.
- Backend logic implementing controllers and models that correctly reflect business requirements.
- Willingness to learn actively seeking out documentation and guidance when facing unfamiliar concepts.
- Debugging systematically tracing and resolving backend errors.
- Persistence continuing to work through difficult issues rather than giving up.
- Attention to detail carefully verifying API request/response data during testing.
- Ability to understand requirements translating module descriptions into working backend features.

5.4.2 Areas for Improvement

- Advanced Laravel architecture:deeper knowledge of service classes, repositories, and design patterns.
- Automated testing : I currently rely on manual testing with Postman and would benefit from learning automated testing frameworks.
- API security :deeper understanding of advanced security practices beyond basic authentication.
- Performance optimization :learning how to optimize queries and application performance at scale.
- Deployment :gaining more experience with deploying Laravel applications to production environments.
- Advanced database optimization :indexing strategies and query optimization for larger datasets.
- Large-scale system architecture : designing systems that scale beyond a single application instance.
- DevOps/cloud technologies :exposure to CI/CD pipelines and cloud infrastructure.

Identifying these areas provides a clear roadmap for my continued learning as I work toward becoming a more well-rounded backend developer.

CHAPTER SIX

CONCLUSION

6.1 SUMMARY OF THE INTERNSHIP

My internship as a Backend Developer / Laravel Intern at Midas Health Services provided an invaluable opportunity to transition from academic learning to professional backend software development. Throughout this period, my primary focus was on designing and developing the Staff Attendance and Roster Management System, a healthcare-oriented application built using PHP, Laravel, and PostgreSQL.

By actively participating in this project, I gained practical experience in database design, Laravel migrations, Eloquent ORM, REST API development, backend validation, authentication, and API testing using Postman. I also gained experience managing a PostgreSQL database using DBeaver. Working directly alongside experienced developers fostered strong professional communication and helped me understand real-world backend development workflows.

6.2 OVERALL EXPERIENCE

Looking back at my time at Midas Health Services, the overall experience can be described as both challenging and rewarding. It provided a good balance between independent problem-solving and collaborative teamwork, making it a valuable environment for someone entering the software development field.

One of the most fulfilling aspects of this internship was seeing a real backend system come together from a set of requirements, to database tables and relationships, to working API endpoints that could be tested and verified. It shifted my perspective

from simply learning backend concepts in a classroom to understanding how those concepts are applied to build reliable, real-world applications.

In conclusion, this internship provided exactly what I needed to bridge the gap between being a student and becoming a backend development professional. It transformed my theoretical knowledge of PHP, Laravel, and databases into practical, industry-ready skills. I am leaving this experience with a stronger technical foundation in backend development and increased confidence to take on more advanced backend engineering roles in my future career.

REFERENCES

To support the backend development practices applied during the internship, several official documentation sources were referenced. Below is the list of references used for learning and applying backend development concepts:

- Laravel. (n.d.). Laravel Documentation. Referenced for understanding MVC architecture, routing, Eloquent ORM, migrations, and validation.
- The PHP Group. (n.d.). PHP Manual. Referenced for core PHP language concepts used throughout backend development.
- PostgreSQL Global Development Group. (n.d.). PostgreSQL Documentation. Referenced for understanding relational database concepts and configuration.
- Postman. (n.d.). Postman Learning Center. Referenced for standard practices on testing REST APIs and validating request/response data.
- [Insert any additional references actually used, e.g. specific books, articles, or internal documentation, in a consistent academic referencing style.]
